

# Raw report: Birth weight

*Cyril Matthey-Doret*

*November 3, 2016*

Visualising the data reveals that premature babies are heavier than the others (Figure 1). These results are surprising and should be interpreted with caution as there may be a mistake in the data. The factor levels may for example have been switched.

If we consider the data to be valid anyway and analyze it, we can build a linear model and perform an ANOVA on it, as the data is normally distributed (Figure 2).

Normal Q-Q Plot
